

## EDUCATION

---

**University of Pennsylvania**, Philadelphia, United States Aug. 2023 — May. 2025 (expected)

M.S.E. in Scientific Computing

Current GPA: 3.95/4.00

- Selected Courses: CIS 5450 Big Data Analytics (A), CIS 5810 Computer Vision & Computational Photography (A), ESE 5460 Principles of Deep Learning (A), ESE 6050 Modern Convex Optimization (A), ESE 6500 Learning in Robotics (A-), STAT 5330 Stochastic Processes (A)

**Wuhan University**, Wuhan, China

Sep. 2019 — Jul. 2023

B.E. in Engineering Mechanics

GPA: 3.68/4.00

- Thesis: *Solving the Plane Thermal Stresses Problem using Deep Operator Network*
- Honors: Third Prize Scholarship (Top 30%), 2020 and 2021; Guangzhou Alumni Association Scholarship Grant, 2020; Jucheng Self-improvement Scholarship, 2022
- Selected Courses: Advanced Mathematics (91), Linear Algebra (97), Probability and Mathematical Statistics (98), Computational Method (99), Matlab Programming (95), Machine Learning and Pattern Recognition (93), Complex Function & Integral (98)

## RESEARCH INTERESTS

---

- Large Language Models (LLMs): LLM Understanding, LLM Acceleration, Safe Generative AI

## RESEARCH EXPERIENCES

---

Mentors: **Zhenmei Shi**, **Yingyu Liang**, and **Zhao Song**

Remote, Mar. 2024 — Present

- Multi-Layer Transformers Gradient Can be Approximated in Almost Linear Time (OPT @ NeurIPS 2024, Submit to ICLR 2025) [\[Paper\]](#).  
We prove that gradients in multi-layer transformer models can be computed in almost linear time  $n^{1+o(1)}$  using a novel fast approximation method with polynomially small error, overcoming the quadratic complexity bottleneck of self-attention and enabling more efficient training and deployment of long-context language models with general loss functions and common sub-modules like residual connections, causal masks, and multi-head attention.
- Differential Privacy of Cross-Attention with Provable Guarantee (SafeGenAi @ NeurIPS 2024, Submit to ICLR 2025) [\[Paper\]](#).  
We present the first differential privacy (DP) data structure for cross-attention modules—securing sensitive information in key and value matrices across AI applications like retrieval-augmented generation and guided stable diffusion—with theoretical guarantees on privacy and efficiency, robustness to adaptive attacks, and potential to inspire future privacy designs in large generative models.
- Tensor attention training: Provably efficient learning of higher-order transformers (AFM @ NeurIPS 2024, Submit to ICLR 2025) [\[Paper\]](#).  
We prove that, under bounded entries, the backward gradient of tensor attention can be computed in almost linear time—overcoming the  $O(n^3)$  complexity barrier—and propose efficient methods to enable practical higher-order transformer training with tensor attention architectures.
- Fine-grained Attention I/O Complexity: Comprehensive Analysis for Backward Passes (Submit to ICLR 2025) [\[Paper\]](#).  
We establish tight I/O complexity bounds for attention mechanisms in large language models across small and large cache sizes—confirming FlashAttention’s optimality in large caches, improving algorithms for small caches, extending analysis to sparse attention, and offering insights for efficient LLM training and inference.

## PROJECTS

---

- GPT2-tinytiny Nov. 2023 — Dec. 2023
  - Develop and fine-tune a GPT2 model as part of the ESE 5460: Principles of Deep Learning course at the University of Pennsylvania with the code and detailed report available on [GitHub](#).
  - Implement GPT2 from scratch in PyTorch, pre-train on the WikiText dataset, and perform supervised fine-tuning (SFT) on the LIMA dataset using Low Rank Adaptation (LoRA). Evaluate and analyze the model's completions for given prompts.
- Dog Behavior Classification with Time Series Movement Dataset Nov. 2023 — Dec. 2023
  - Conduct a data science project for CIS 5450: Big Data Analytics at the University of Pennsylvania and participate in a Kaggle competition with the code and slides available on [GitHub](#).
  - Preprocess accelerometer and gyroscope data collected from dogs' necks and backs. Carry out Exploratory Data Analysis (EDA) and feature engineering for data cleaning and transformation. Leverage Plotly for visualization, employ resampling for uniform data distribution, and implement multiple models (random forest, GRU, ResNet) for classification. Achieve a 93.6% accuracy, outperforming the original paper's SVM-based accuracy of 91.4%.
